License Manager

Management decision report

Option A versus Option B | 31 October 2026

Verified position

The authenticated local application was inspected read-only. Reconciliation displayed 1,043 BOEs, 317 import invoices, 2 matched, 53 unmatched invoices and 1,699 duplicate-debit findings. These are confirmed as screen metrics, not confirmed financial errors: their query/counting semantics require source-record validation. Dashboard displayed 109 Missing DGFT records; E1 planning displayed 2 validation issues. No data mutation or accounting operation was performed.

Decision summary

Primary value	Reliable licence operations sooner	Operations plus internal financial control
Accounting	Excluded	New GL/AR/AP/bank foundation
Likely effort	445 days	775 days core
Solo maintenance	Lower	Higher policy/control burden
Migration risk	Operational data remediation	Operational plus accounting cutover
Recommended when	1-2 staff use external accountant/Tally	External accounting blocks daily control and CA is available

Recommendation

Choose Option A first. It addresses the verified risks that most directly threaten a small business: data integrity, operational reconciliation, licence/restriction correctness and company isolation. Make Option A accounting-ready through stable company/source-document references, but do not prematurely build journals.

When Option B is preferable

Choose Option B now only if the owner needs reliable in-app receivables/payables, expenses, cash/bank visibility and financial close, accepts the longer implementation/cutover, and can obtain CA-approved chart, tax, opening-balance and migration decisions.

Owner decisions before approval

Confirm internal vs external SaaS target; restriction/AU definitions and authoritative evidence; historic correction policy; approval thresholds; essential reports; accounting now/later; and, if B, chart/period/tax/Tally/bank format/cutover owner.
